CyberSafe Campus

OPCODE IMPACT 2026 | Hackathon Submission

Team ID: OPCO21

1. Problem Statement

Educational institutions face cybersecurity incidents such as phishing, fake links, suspicious messages, account compromise, cyberbullying, and unauthorized access. Students and staff often lack a centralized and organized way to report these incidents. Evidence may be lost, complaints may be duplicated, and tracking incident status can be difficult. CyberSafe Campus aims to simplify incident reporting and improve campus cybersecurity awareness through a centralized digital platform.

2. Solution Title

CyberSafe Campus: Secure Digital Incident Reporting and Evidence Management Platform

3. Solution Description

CyberSafe Campus is a web-based campus safety prototype designed to help users report campus issues and learn about cybersecurity. The current prototype provides a responsive homepage, an incident reporting form, complaint ID generation, and local complaint tracking using browser storage. It also includes cybersecurity awareness tips covering password safety, phishing, online privacy, and suspicious activity. The current demonstration stores reports locally in the user's browser; backend integration and centralized incident management are planned for future development.

4. Architecture Diagram

```mermaid

flowchart TD

  A\[User / Browser] --> B\[HTML5 Interface]

  B --> C\[CSS3 Styling]

 B --> D\[JavaScript]

  D --> E\[Incident Reporting Form]

 E --> F\[Generate Complaint ID]

 F --> G\[Browser localStorage]

 G --> H\[View Saved Reports]

 B --> I\[Cyber Safety Information]

Workflow: Users access the website and submit an incident report through the form. JavaScript validates the required fields, generates a complaint ID, and saves the report in browser local storage. Users can view reports saved in the same browser and access cybersecurity awareness information.

Note: This diagram represents the current prototype. Node.js, Express.js, REST API, and MongoDB integration are planned for the backend architecture and should be added to the diagram once implemented.

5. Technology Stack
```

-Frontend: HTML5, CSS3, Bootstrap,JavaScript

- Current Data Storage: Browser localStorage

- Planned Backend: Node.js, Express.js

- Planned API: REST API

- Planned Database:MongoDB

- Version Control: GitHub

6. Quick Start Guide

Prerequisites:

- A modern web browser, such as Google Chrome

- A code editor such as Visual Studio Code

Installation and Execution

1. Download or clone the project files.

2. Open the project folder in Visual Studio Code.

3. Locate the main HTML file containing the supplied source code.

4. Open the HTML file directly in your browser, or use the VS Code Live Server extension.

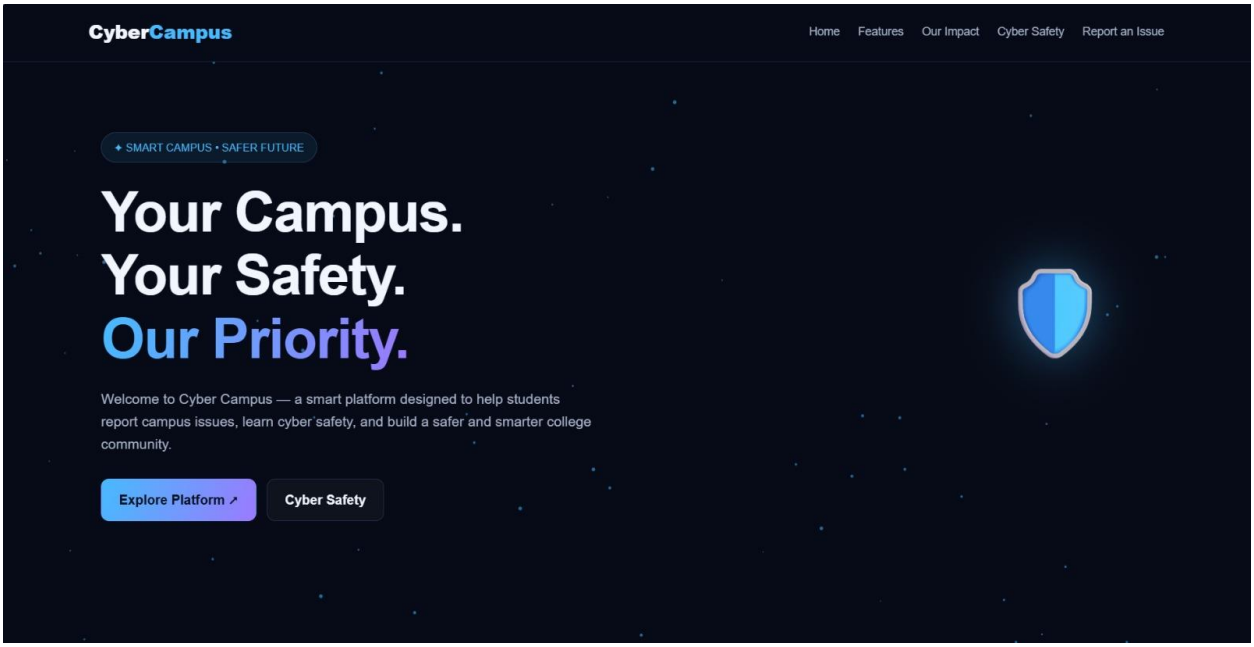

5. Navigate to the reporting section and submit a sample report to test the prototype.

Note: The current supplied source is a standalone HTML file. Node.js, Express.js, and MongoDB are not required to run this version.

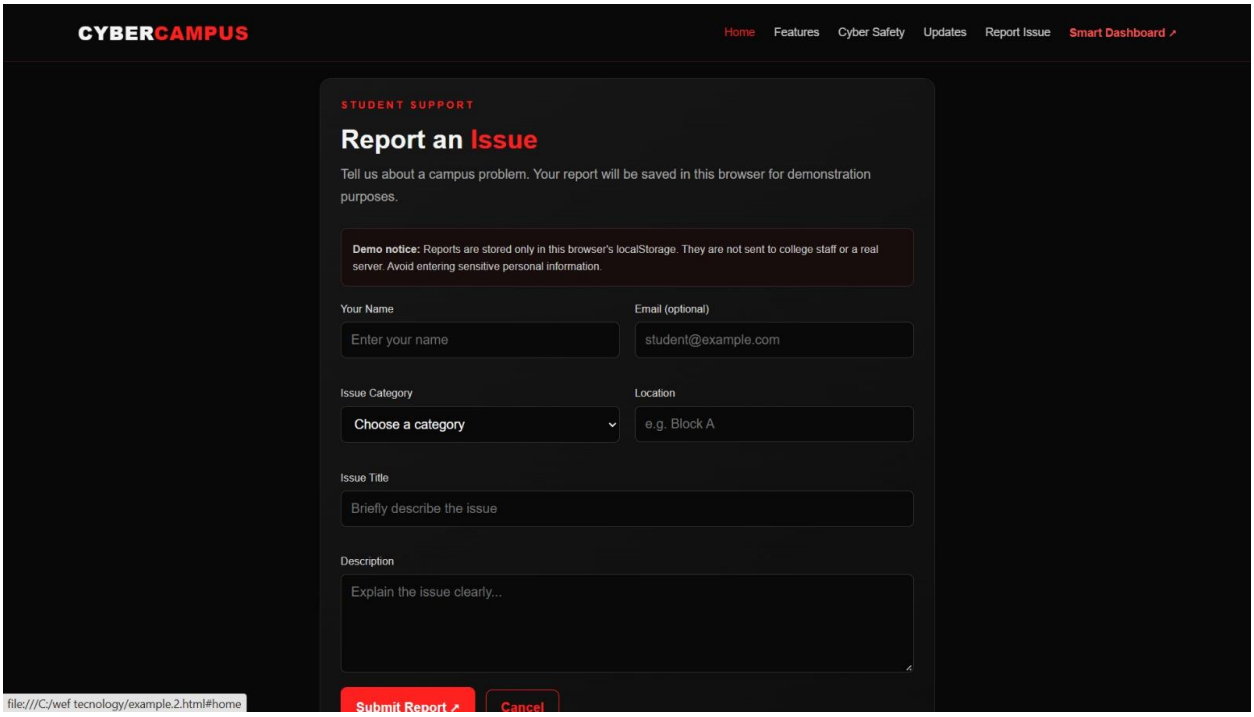

7. Output Screenshots

Add screenshots of your actual running prototype to the `docs` folder.

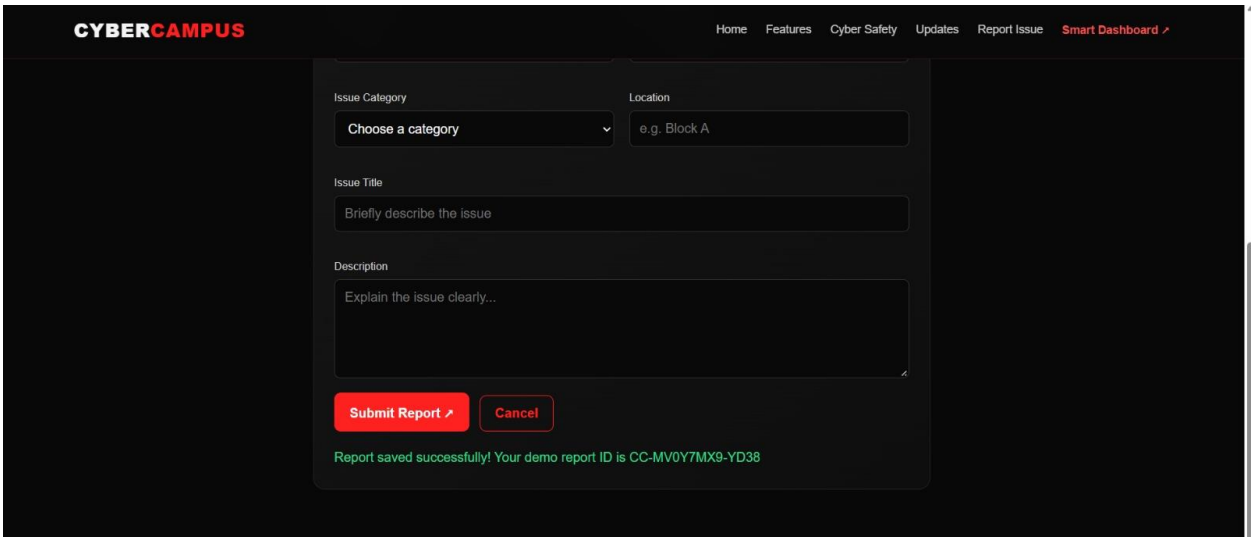

Homepage and navigation

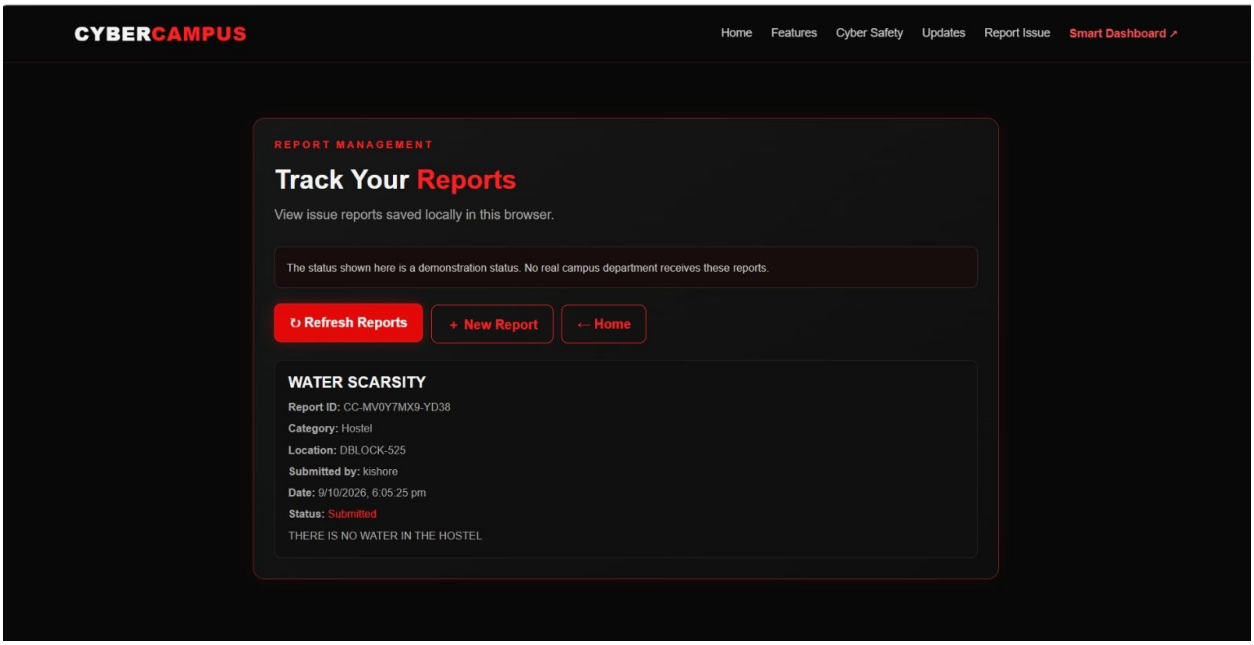

Incident reporting form

Successful report submission and complaint ID

Saved complaint tracking page

Replace these example paths with the actual screenshots you include in the repository.

Output Description: The prototype displays a responsive campus safety website with a reporting form, locally generated complaint IDs, saved report listings, and cybersecurity awareness information.

8. Future Scope

- Integrate Node.js and Express.js to provide backend services.
- Connect MongoDB for centralized incident storage.
- Implement secure evidence uploads for screenshots, suspicious URLs, and other supporting files.
- Introduce user authentication and role-based access control.
- Develop an administrator dashboard for incident review, prioritization, and status updates.
- Add incident statistics, notifications, and improved threat awareness resources.

9. Team Contributions

Member Name	Contribution
Rathinavel Muthukrishnan	Team Leader / Cybersecurity
Kishore M.	Development / Backend
Adithya K.	Security / Research
Ranjith Kumar S.	UI / Data / Testing

10. Tools Used

Tool / Platform	Purpose / Why Used :
HTML5	Structure of the web interface

CSS3	Responsive layout, styling, and animations
JavaScript	Form validation, complaint ID generation, navigation, and local storage
Bootstrap	Responsive grid system, navigation components, and mobile-friendly layouts
VS Code	Source code editing and development
Git	Version control
GitHub	Planned source code hosting and collaboration
Node.js	Planned backend development
MongoDB	Planned database integration

Project Status: Prototype in progress.
